

Background

The convergence of real and virtual communication is progressing. NTT laboratories is going to take that even further, and is aiming for a world where we can expand the opportunities for building relationships by incorporating realistic virtual alter egos as part of real communication.

Summary

To transcend the spatiotemporal constraints of communication, mirror interfaces and digital alter egos seamlessly connect real and virtual. We expand the possibility of communication by communicating with virtual people with high reality.

Features

- With optical ingenuity, the virtual agent is not just displayed on the screen, but is represented as if it is actually adjacent to a mirror image of a real person
- Create a digital alter ego of a person, not just the way they look, but also their voice and speech

Future_benefits

It will enable to communicate with people you have had to give up in the past in a realistic state, and form relationships that you have never been able to do in the real world.
