RDMA Remote Direct Memory Access

RDMAによりCPUのオーバーヘッドを削減
Overhead reduction bypassing CPU by RDMA

遅延・消費電力を最大約60%削減
Latency・Power reduction up to 60%

///Technical Issue

CPU performs GPU control and communication, which consumes a large CPU power and causes communication delays.

///Research Goal

By efficiently using GPUs in remote locations to reduce cost and reduce power consumption by 1/8 compared to 2020.

---Technology

- Low-latency remote communication by RDMA over APN.
- CPU offloading, efficient accelerators connection.
- Controller software which allocates computing resources appropriately according to the situation.

---Applicable Business

In ICT industry and service industry, use cases for security monitoring and behavior analysis using multiple cameras across various locations, which is required for the realization of smart cities and digital twins. (around 2027) [market size: $18B*]

* 2026 market size forecast for composable infrastructure.

---Novelty

Enables low latency transmission of large size video streaming by RDMA to remote locations. Reduce the number of servers by up to 70% and power consumption by up to 60% in IOWN Global Forum PoC by RDMA NIC and GPU direct transmission.
